movements[Alkaline phosphatase: a new marker for the diagnosis of liver cirrhosis?]. Alkaline phosphatase (ALP) has been known as a marker of liver function and a tumor marker for several years. Since 1987 ALP serum levels were determined in several hundred patients with liver cirrhosis, their liver diseases and liver transplantations, and their data were compared with the findings of other

established markers, such as bilirubin, g-glutamyl-transferase (GGT), a-feto-protein (AFP), and albumin. The results of our investigation indicate that ALP serum levels may also serve as a valuable, new marker of liver cirrhosis.

Predicting Intrathecal Drug Action by In Silico Modeling of Membrane Transport and Model Calculation of the Passive Diffusion Pathway.

The presence of the blood-brain barrier (BBB) limits the delivery of therapeutics to the brain. Drug flux through this barrier consists

of an active component, which represents active transport via transporters and ion channels, and a passive component that results from the diffusion of drug molecules across the barrier. This study developed a predictive model that quantifies the passive diffusion component and thus can predict the extent to which the BBB limits the delivery of drugs to the brain. A physiologically based mathematical model was developed to describe the passive diffusion of drugs across the BBB and the

resulting concentration of drug in the brain parenchyma. Two in silico models that simulate the passive diffusion of drugs across the BBB were developed: the radiopharmaceutical (RPH) model that uses the measured distribution of the blood-to-brain gradient of technetium-99m diethylenetriaminepentaacetic acid (^{99m}Tc -DTPA) and the RPH excretion model that simulates the passive diffusion of ^{99m}Tc -DTPA and ^{99m}Tc -HSA after its excretion

from the body. The *in silico* RPH models predict the concentration of drug in the brain parenchyma across a range of physiologic conditions, and the results are compared to previous experimental findings. The RPH models are then used in simulation experiments to quantify the BBB permeability of seven antiepileptic drugs. *In silico* RPH and RPH excretion models predict blood

Moore: The Food Stamp Challenge Post Date:12/12/2016 6:06 PM

The USDA continues to issue notices about inaccurate or fraudulent uses of the Supplemental Nutrition Assistance Program (SNAP, commonly called food stamps). And when I say “SNAP,” I do mean food stamps; SNAP isn’t limited to “food.” Also, I’m speaking only of the regular food stamp program, not the “SNAP

Children's Program.” This is the story of a challenge I received in my food stamp challenge from July 24 through September 2, 2016. On July 24, I sent a letter to the USDA for which I received a response on September 8, 2016. It was a letter admitting that the SNAP database had incorrectly reflected that I had received \$308 in SNAP benefits during July 2014. In fact, I had not. These represent the three stamps in my jar that are currently being renewed as I wrote this. I didn't notice the stamps were in

error because at the time the incorrect information was entered, I had just purchased 40 gallons of gas, \$56 in paper goods, and \$3 in groceries. Of course, I'm on a budget, so I can't afford to buy those things over and over. Also, I've been sending people to the grocery store once a week to pay for those things, so I don't remember having received them. Because of the SNAP card being in error, I'm paying for SNAP benefits that I didn't receive, which means that money doesn't go to the needy. It

comes out of my general food budget.
I'm not sure why the SNAP program
is tracking my 82138339de
