Eliminate the need to install a new Windows setup project in the dev environment Support for all Genuine Advantage Notifications Replace the original executable which only supports IE based checks Allow the end user to check and fix the Windows Genuine Advantage Key via a

System Pop Up Support 1, 2, 3, and 4 Key windows for GC (GC has been updated to include XP as a supported OS, not GC) This is to update our previous post regarding KB905474 (Windows Genuine Advantage Notifications). This post provides an additional description on what the keymacro is and what it can do. Windows Genuine Advantage is a security feature that helps to protect the authenticity of a system that uses Windows Genuine Advantage and Windows Updates. The security feature is being used to assist in detecting whether or not the system has an authentic copy of Windows and if the system is a genuine Windows system. While these issues are important to address, we also wanted the utility to be user friendly. While there are 2 ways to update the Windows Install CD, to be very honest, I don't think you want the end user to have to make those two calls when they can have one install cd in their computer. How does this work? The keymacro reads the WGA product key and determine if it matches the product key on the Windows XP setup. If it does match, it replaces the original executable which is in the system partition with a modified executable which will read the product key and call the Windows Update to retrieve the required information. This will allow for a new "check-and-fix" process in the form of a system pop up. Install Notes: A number of updates are needed to properly support the check-and-fix process. KB905464 Windows Update Installation issues are being addressed for some older PC hardware. As of WGA v. 3.02 there is no installation issue for the current user (check this article for details). KB905474 Support for the Windows Genuine Advantage Key has been added to GC. KB905467 The Patch, KB904002, has been removed. The focus is being placed on the Windows Update (WUA) and Genuine Advantage (WGA) checks. KB905464 Issue with Windows Update has been addressed. What's New In RyanVM WGA Addon?

This is a binary file written to the root of the Windows XP installation disc. If it is run in user mode, the NT kernel will start up and notify the user that he must activate Microsoft's key. If it is run in kernel mode, the user is prompted to supply his verification code. The WGA code must be located in the beginning of a drive, and the root path must be specified in the CD boot parameter. Instructions: In user mode, you would double-click on the file. If you wish to run in kernel mode, change the "KernelMode=1" line in the configuration file to "KernelMode=0". Note that this code is binary. If you have any problems installing or executing it, contact the author of the code for support. Note: The WGA subsystem in the Windows operating system runs in the Real Mode of the CPU (except in extended mode), which means that Windows expects BIOS and hardware in particular configurations. Because of this, the minimum requirement for the Linux kernel is 2.0.1, and the minimum requirement for Windows XP is Service Pack 2 (SP2). If your system does not meet these requirements, you will not be able to execute the code. If you have any questions, please contact the author.
