It is well documented that violence is a serious public health problem for youth. There are very few school-based programs designed to prevent the initiation and escalation of youth violence, and it is unclear whether these programs are effective. The lack of effective programs is the result of limited knowledge about which program elements should be included in violence prevention programs. This article addresses the development of methodologies for the assessment of youth violence prevention programs. It is important to develop instruments that have high measurement quality, adequate reliability, and provide valid and reliable measures of youth violence prevention program outcomes. Current youth violence prevention instruments are based on program logic and on the violence prevention model. They are primarily designed to measure the effectiveness of school-based programs and lack a youth-oriented perspective. We identified the current knowledge of youth violence prevention programs and the possible content and structure of instruments that should be developed to measure youth violence prevention programs.In the manufacture of a fiber optic module, a jacket (e.g., a surrounding housing that may be formed from a polymer material) is typically required to enclose a length of fiber optic cable, thereby providing protection and a means for securing the fiber optic cable within the fiber optic module. Typically, the fiber optic module is installed and placed on a printed circuit board (PCB) and then a jacket is applied over the fiber optic module to cover the length of fiber optic cable. The end of the jacket is typically fused with the PCB via an adhesive to secure the fiber optic module to the PCB. Thereafter, the fiber optic module

### What's new:

**holds firm under sober scrutiny If Sunrise's faux-Almodovian deadpan-hyperactivity of the past brought us The Transistor then Chasing the Dragon with its fertile learning experiences helped to prepare for its comparison to massive sci-fi junk pile Dead Space. Nope, they're not in the same league, nor are they the same kind of game at all. Dead Pixels, a DS Vita hack-and-slasher tailored to the mobile, mashes today's indie, smartphone 'content economy' with today's videogame medium. It's a dead retread nailed to the cross. While the scenes in the game are vibrant, familiar scenes that are virtually indistinguishable from other production-design-archetypical sci-fi dramas that have been created in the last century, they're all done over a nothing core. Oh yeah, in-game you're a green-skinned hoover, and your sole mission is to clean up the discarded remains of the humans who live in this dystopian universe. Unlike the previous examples of Grosse Point Games' output, Strange Flavour Studios' sequel actually does a tremendous job with the perspective of everyday story that's on display in the game. There are verbal bodies littered around the city and their removal is clearly visible, just as you'd expect from a game in today's era. "Dead Pixels, Holy F\*ck," [laughs] I thought when playing for the first time. Its look and feel is the main gem in a spooky mobile game with a dark sci-fi universe backdrop. The dead humans that you have to clean up in this pop-science environment are sewn from their own skin and blood, the rest of their bodies is rendered in a grey colour palette. Flowing around the city is a stream of black blood. The grey walls in the background, the rocky city environment and the gothic piano music set the tone perfectly. The character animation is minimal and the button-bloated controls just make it more crunchy. Is it working though? Well, I would say it's not terrible at all, at least not in the same vein as Dead Space [laughs]. [Vincent Yang, studio manager, Strange Flavour Studios] Our boss, Chris, [Ono, director/design**
