We present a method for detecting an oscillation in one part of a condensate with a different frequency than that in the other part. A superconducting quantum interference device (SQUID) is used to detect local changes in the conductance of a microconstriction. We show that a reduction of the condensate conductance in the order of one has a clear signature of the condensate oscillation. This detection technique, applied to a micrometer-sized condensate, can reveal oscillations with an amplitude as small as 10(-7)(8) of the conductance quantum, and could provide a sensitive method to reveal an oscillation in the condensate amplitude.What got me thinking about this was I was riding up Treasure Mountain recently when I saw quite a few cyclists. It was nice to see so many people out 0cc13bf012
