1. Field of the Invention The present invention generally relates to a motion compensation apparatus, and particularly relates to a motion compensation apparatus in which a motion vector between a current block and a reference block is detected. 2. Description of the Related Art A conventional motion compensation apparatus is disclosed in, for example, Tokkaihei 6-121343. FIG. 1 is a block diagram of the conventional motion compensation apparatus in which a motion vector between a current block and a reference block is detected. A differential image signal between an input current block and a reference block is inputted to an input terminal 2. The input current block and the reference block are both stored in a frame memory 1. A reference image signal is read out from the frame memory 1 in response to a signal read-out request, and the reference image signal is inputted to a subtracting circuit 3. The subtracting circuit 3 subtracts the input current block from the reference block. A motion vector detecting circuit 4 detects a motion vector of the current block and the reference block from the differential image signal outputted from the subtracting circuit 3. An image signal outputted from the motion vector detecting circuit 4 is inputted to a prediction circuit 5 and a motion compensation circuit 6. The image signal outputted from the motion compensation circuit 6 is outputted from an output terminal 7. In the conventional motion compensation apparatus thus arranged, as shown in FIG. 2, the differential image signal (current block image) obtained by subtracting the reference block image read out from the frame memory 1 from the input current block image is outputted as it is. Each block in the differential image signal has a value calculated at each pixel point. It is assumed that the block has such a size as to be able to be accommodated in a field image memory (frame image memory). The reference image signal to be subtracted from the differential image signal is formed by selecting the reference block image of the size that can be accommodated in the frame image memory 1. However, in order to ensure that the differential image signal has the size corresponding to the reference block image

What's New in the Speedy RM To MP3 Converter?

- Speedy RM to MP3 Converter is a lightweight program designed to help you quickly encode files with the RM and RMVB formats to audio tracks with the MP3 extension. It can be easily used by rookies. - The interface of the tool is based on a standard window in which you can import media files by using the file browser only, since the "drag and drop" method is not supported. Batch processing is allowed. - In the list you can check out the source path and result of each file. Once you specify the output directory (same as the original files of custom), you can proceed with the conversion process. In addition, you can select the Real Video decoder. - The straightforward audio processing tool immediately completes a job while using a low-to-moderate amount of system resources. We haven't come across any issues during our testing, since Speedy RM to MP3 Converter did not freeze, crash or pop up errors. The sound is preserved at a very good quality and there's also a brief help file that you can check out. - On the other hand, you cannot configure MP3 output settings (e.g. sample frequency rate, channels, volume, bit rate) or program options (e.g. enable Speedy RM to MP3 Converter to automatically turn off the computer after conversion). But we recommend it to all users who are looking for a quick solution to RM-to-MP3 conversions.

Generation of a tetracycline-inducible transgenic Cre-recombinase transgene in the mouse. The Cre-LoxP system has been widely applied to regulate gene expression in mice. The susceptibility of Cre to leaky expression precludes robust results. A transgenic Cre-recombinase transgene (tetO-Cre) was created with a tetracycline (Tet)-responsive expression system, the rtTA off-tetP-rtTA on-tetP-rtTA-2A-EO2-tetO-eGFP mice. When the mice are treated with Tet, Cre is constitutively expressed due to the rtTA activator. Expression of eGFP was induced by controlling the production of rtTA. rtTA expression was first suppressed by adding doxycycline to the drinking water. After this period, the expression of Cre and rtTA is increased without the need for additional doxycycline. Finally
