Use a professional graphics program to create a pretty photo that you would like to share online. Just be sure to save the image in the RAW or TIFF format to preserve as much of the image's data as possible so that you don't have to take the time to reshoot it. Also, always shoot in RAW if you want to be as flexible as possible when editing your images. See Book IV Chapter 4 for information about capturing high-quality images in RAW format. Whenever you are reusing a photo in multiple locations, make sure that the photo is in the same size and format as the others. For example, if a photo of a shirt is used in the front, back, and sleeve of a layout, make sure that it's the same size, shape, and quality on all three sites. Use a file organizer, such as Microsoft's OneNote (www.onenote.com), to create a stack of files representing a single photo so that you don't have to find the file with your whole project each time you need to use it. Always select the best image when you want to print something, even if the photo is just for a website. In addition to being the largest and most expensive format, print (and print-quality) images should be the highest quality available for your company's work. Experiment with your photo-editing software! Play with it and see how it works; hopefully you will discover new ways to improve your images. If you have an understanding of different programs, you can become a much more proficient photographer in the long run. Use GIMP (GNU Image Manipulation Program) (www.gimp.org), a free open-source image-editing program, to resize photos, crop them, brighten or darken them, add a decorative border, and so on. Even though it's free, you should still be cautious about downloading and using open-source software because companies may change it at any time, which could potentially hinder your ability to use the software you have purchased. For more advanced image-editing features, download and use Adobe Photoshop Express, which is built into the Express Editions of Adobe products. It's free to use (with ads), and it requires a digital version of the same Adobe creative software for which you are paying. However, with Photoshop Express, you can save your work to the cloud in addition to using the device you are using to edit images. With this method

Further Subpixels in the Attenuation of Ultraviolet Radiation Due to Peroxymonosulfate: Photo-Fenton-like Process. The attenuation of ultraviolet (UV) radiation by aqueous solution of potassium persulfate (KPS) and sodium peroxymonosulfate (SBO) under the illumination of visible light was investigated. The application of SBO as a co-reactant (by chemical oxidation) significantly decreased UV transmittance than application of KPS alone. The synergistic effects of UV attenuation was further enhanced by visible light irradiation. On the contrary, the attenuation of UV was completely reversible upon the addition of EDTA. The changes of optical properties with the presence of Fe<sup>3+</sup> ions suggest that the UV attenuation was a photo-Fenton-like process. The photochemical formation of hydroxyl radicals (·OH) in the presence of SBO was confirmed by the salicylate method. On the basis of UV and the absorption spectra, the enhanced attenuation of UV by SBO was attributed to the formation of intermediate sulfate radicals (SO<sub>4</sub><sup>-·</sup>) that caused the adsorption of solar radiation in UV-B to UV-A range. Search Our Site Sustainability In The Landscape Located near the town of Orchard Park, Greenfield Park is one of those places where you can just sit back, sip a drink and enjoy the atmosphere. The park has a lovely little pond, resting benches and children's playground in addition to the formal seating and a variety of trees and flowers. Unfortunately, like many parks throughout the Buffalo area, Greenfield Park is in need of some TLC. The main issue is that, like many other areas, the park suffers from a lack of public funds. "In terms of manpower and resources, it's not a very well maintained park," says Adrian V. Rasilla, Executive Director of Community Action Partnership of Western New York, which is one of the organization that runs the park. The year round park needs a new roof, park benches, and landscaping. You'd expect, then, that the Buffalo Park District or the Buffalo Niagara Convention and Visitors Bureau would step up, right? Not so fast... The Buffalo Niagara Convention and Visitors Bureau refused to help out with repairs, but as a consolation, gave the park's director some sort of contribution. The

to determine the potential for ACPA production by individual WT cells based on the degree of V-H- usage ([@B21], [B22], [B31]). We observed that the variability in the <sup>α</sup>Id<sup>α</sup> and <sup>α</sup>Id<sup>α</sup> gDNAs correlated with cell size. Thus, the change in hu/wt V-H- usage among the cells in the pool reflected the activity of the <sup>α</sup>IC<sup>α</sup> and altered the level of ACPA. Indeed, our findings indicate that even minor alterations in the <sup>α</sup>IC<sup>α</sup> structure can substantially alter the activity of the <sup>α</sup>Id<sup>α</sup> and <sup>α</sup>Id<sup>α</sup> gDNAs, leading to large changes in the level of ACPA. This report constitutes the first demonstration of a functional variability of the <sup>α</sup>Id<sup>α</sup> and <sup>α</sup>Id<sup>α</sup> gDNAs in the formation of the <sup>α</sup>Id<sup>α</sup> and <sup>α</sup>Id<sup>α</sup> gDNA pools at a single cell level in humans. Although the mechanisms by which the V-H- segments are selected remain unknown, our results provide evidence for an important role of the <sup>α</sup>IC<sup>α</sup>. Our finding that the inhibition of <sup>α</sup>IC<sup>α</sup> function in human cells resulted in massive and selective amplification of a single V-H- segment is reminiscent of the mode of antigen receptor diversification observed in some vertebrates, including chickens and fish ([B32]). In chickens and fish, the amplification of V-H- segments is confined to a single locus and involves the fusion of the newly synthesized V-H- gene segments with a single germline gene that encodes the downstream non-coding region. The functions of the upstream region, in particular, <sup>α</sup>I<sup>α</sup>-H-, are essential for the V-H- segment amplification ([B33], [B34]). In addition, mutations in <sup>α</sup>I<sup>α</sup>-H- have a dramatic effect on the diversity of the V-H- gene ([B35], [B36]). In humans, however, the overall level of <sup>α</sup>Id<sup>α</sup> gDNA was not affected in <sup>α</sup>IC<sup>α</sup>-deficient U2OS cells. Instead, the defect was specific for the production of ACPA. This observation suggests that other factors, rather than <sup>α</sup>I<sup>α</sup>-H-, might be involved in the regulation of the <sup>α</sup>Id<sup>α</sup> and <sup>α</sup>Id<sup>α</sup> gDNAs. The repertoire of somatic hypermutation
